

Explorations in Ruby: Practicals

Week 9: Practical 9

- 1) Use ActiveRecord to set up a database with a number of records in it. The database should contain records for library users (with fields for name, age, books borrowed) and library books (with fields for borrower, title, borrowed-when, dueback). Note, it should be set up so that a borrower can borrow many books. Create classes for these objects and then use *find* to print out the attributes of the various records that you have created.
- 2) Do something really smart with the blocks and lambda stuff shown in the notes.

Note, some people think that it is ok to copy something from the internet to answer these questions.

Be aware, that this is not an acceptable answer.

You need to create the answer yourself from scratch and from reading the notes.

thanks.
